INTRODUCTION

Carbon2Chem®, a cross industrial network of steel and chemical industries enables the utilization of metallurgical gases for synthesis of value-added chemicals. Coke oven gas (COG) is a valuable source of hydrogen for syngas utilization. The removal of oxygen from COG is an essential step to allow a high H₂ recovery in safe environment of the subsequent pressure swing adsorption (PSA) process. The orientation study uses a factorial experimental design (DoE) to determine the influence of different process parameters on the catalytic removal of oxygen traces (4500 – 9000 ppm O₂). This study focuses on the activity of the transition metal sulphide catalyst. For the removal of oxygen from synthetic COG, the activity of the commercial catalyst CoMo/ γ -Al₂O₃ was compared to the Pt/ γ -Al₂O₃ reference catalyst.

CONCEPT

Carbon2Chem® - „Dirty-de-Oxo“

- Catalytic oxygen removal from a raw COG in the presence of multiple trace components
- Systematic investigation of trace components, e.g. H₂S, COS, Toluol → catalyst poisoning
- Three catalyst systems from Clariant Produkte GmbH are evaluated for the process; Pt based catalyst versus transition metal based catalysts, Co- and Nickel-molybdenum based systems

CONCEPT

Structure-Activity Relationship

- Development of the sulphidation process
- In-situ regeneration in the presence of H₂S

STRUCTURE

CATALYST CHARACTERIZATION

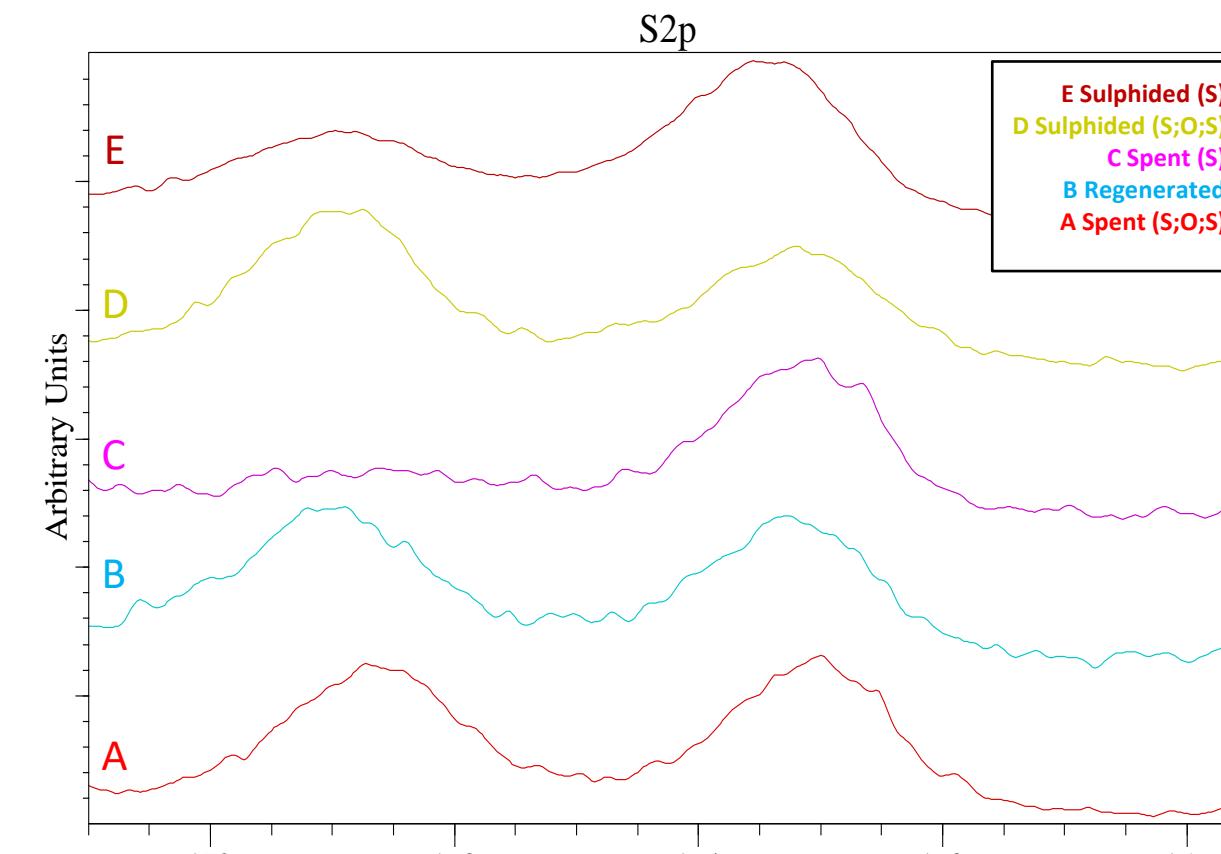

Fig.3 S 2p XPS results of the CoMo catalyst; spent, regenerated, sulphided samples.

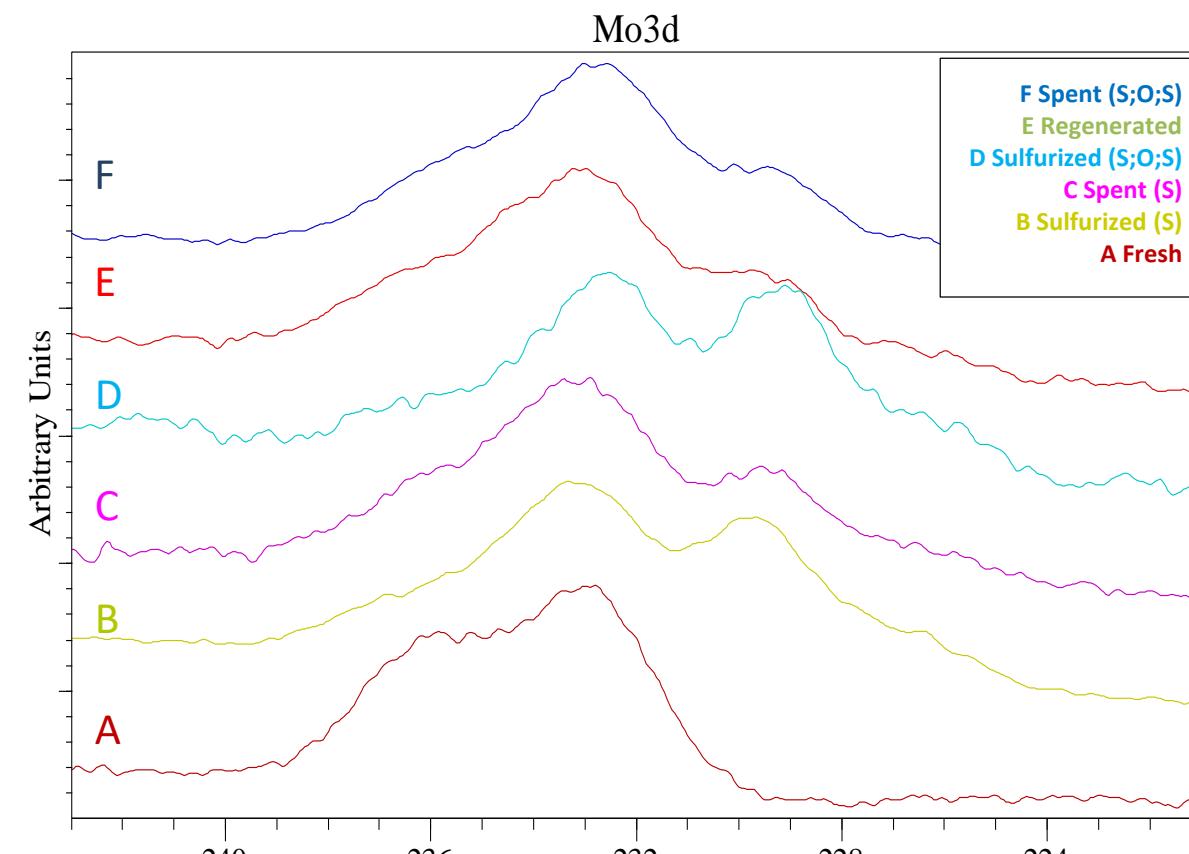

Fig.4 Mo 3d XPS results of the CoMo catalyst; spent, regenerated, sulphided samples.

- Application of the characterization methods, e.g. XRD, XPS to identify the stable active phase

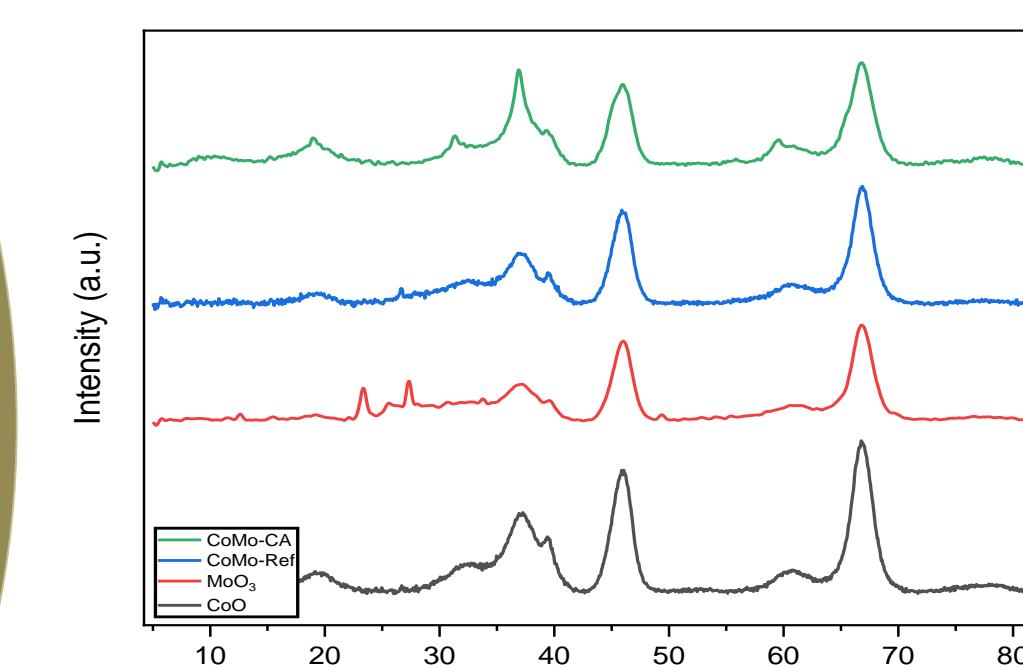

Fig.5 XRD results of the Co and Mo components.

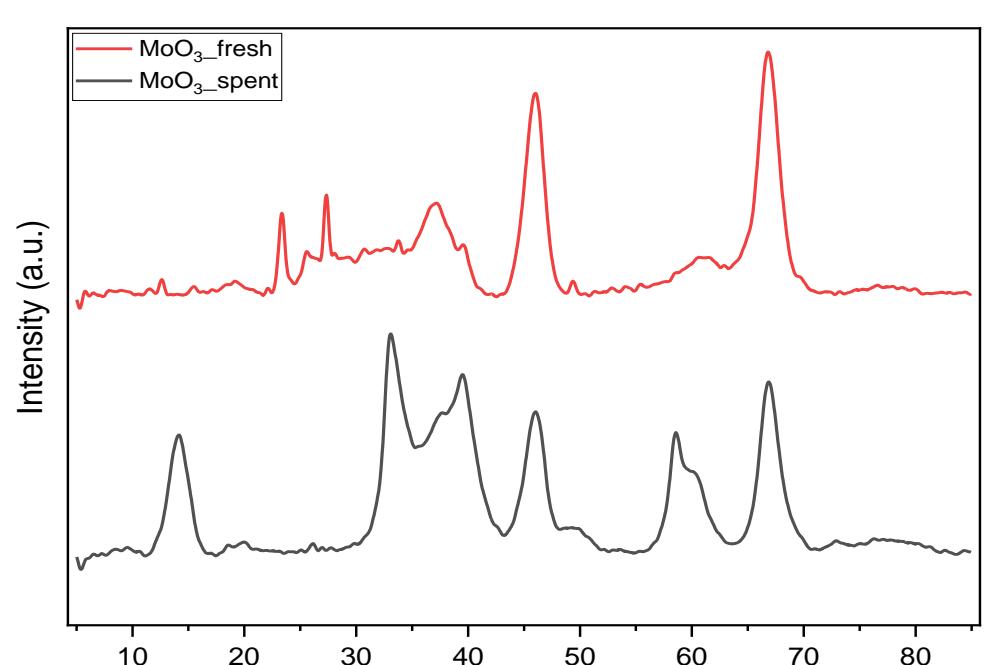

Fig.6 XRD results of the Mo components.

CATALYST TESTING

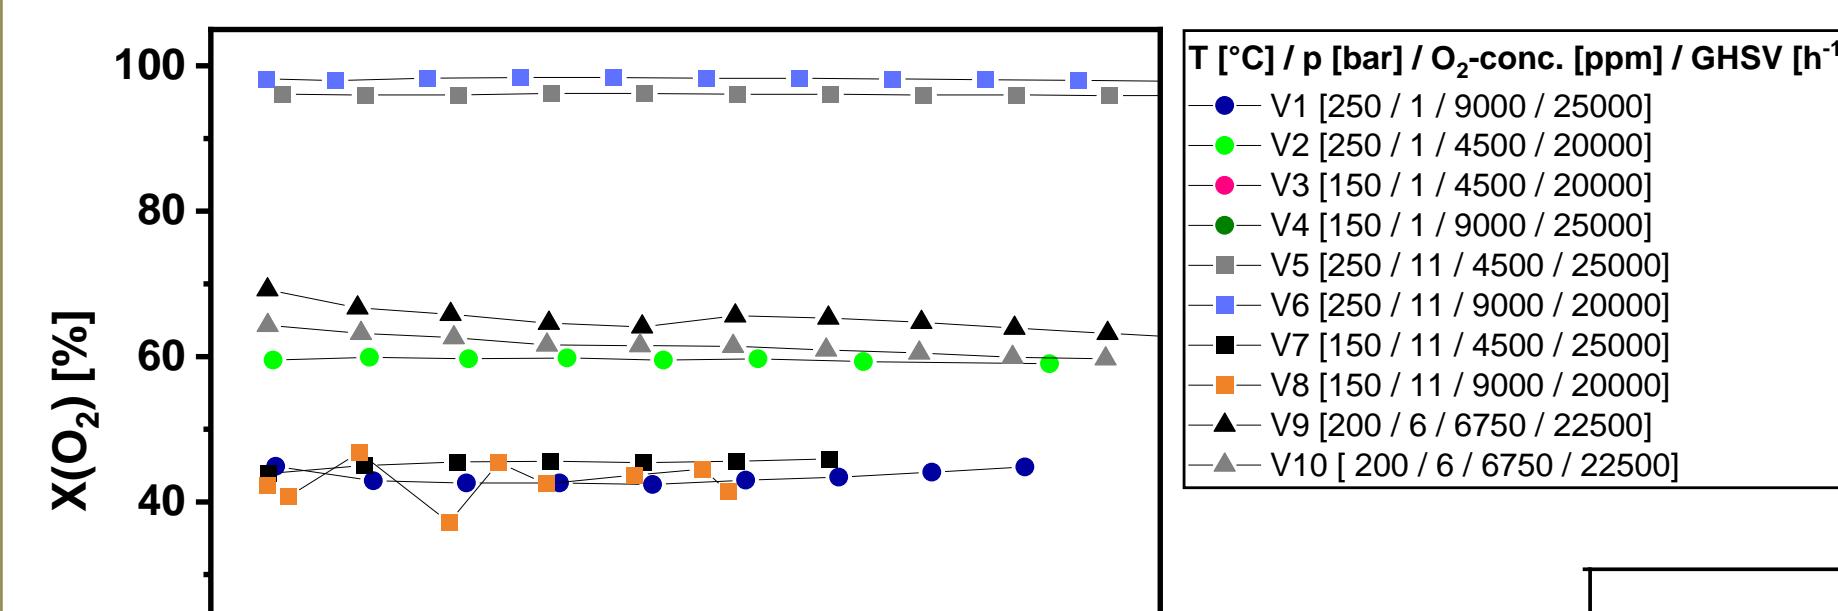

Fig.7 O₂-conversion of the Pt/γ-Al₂O₃ catalyst in the absence of H₂S; T=150–250 °C, GHSV_(STP)=20000–25000 h⁻¹ at 1–11 bar.

Design of Experiments

An iterative experimental design is determined for the systematic study of the present catalyst system. Therefore, a factorial experimental design applying four factors at two levels is established.

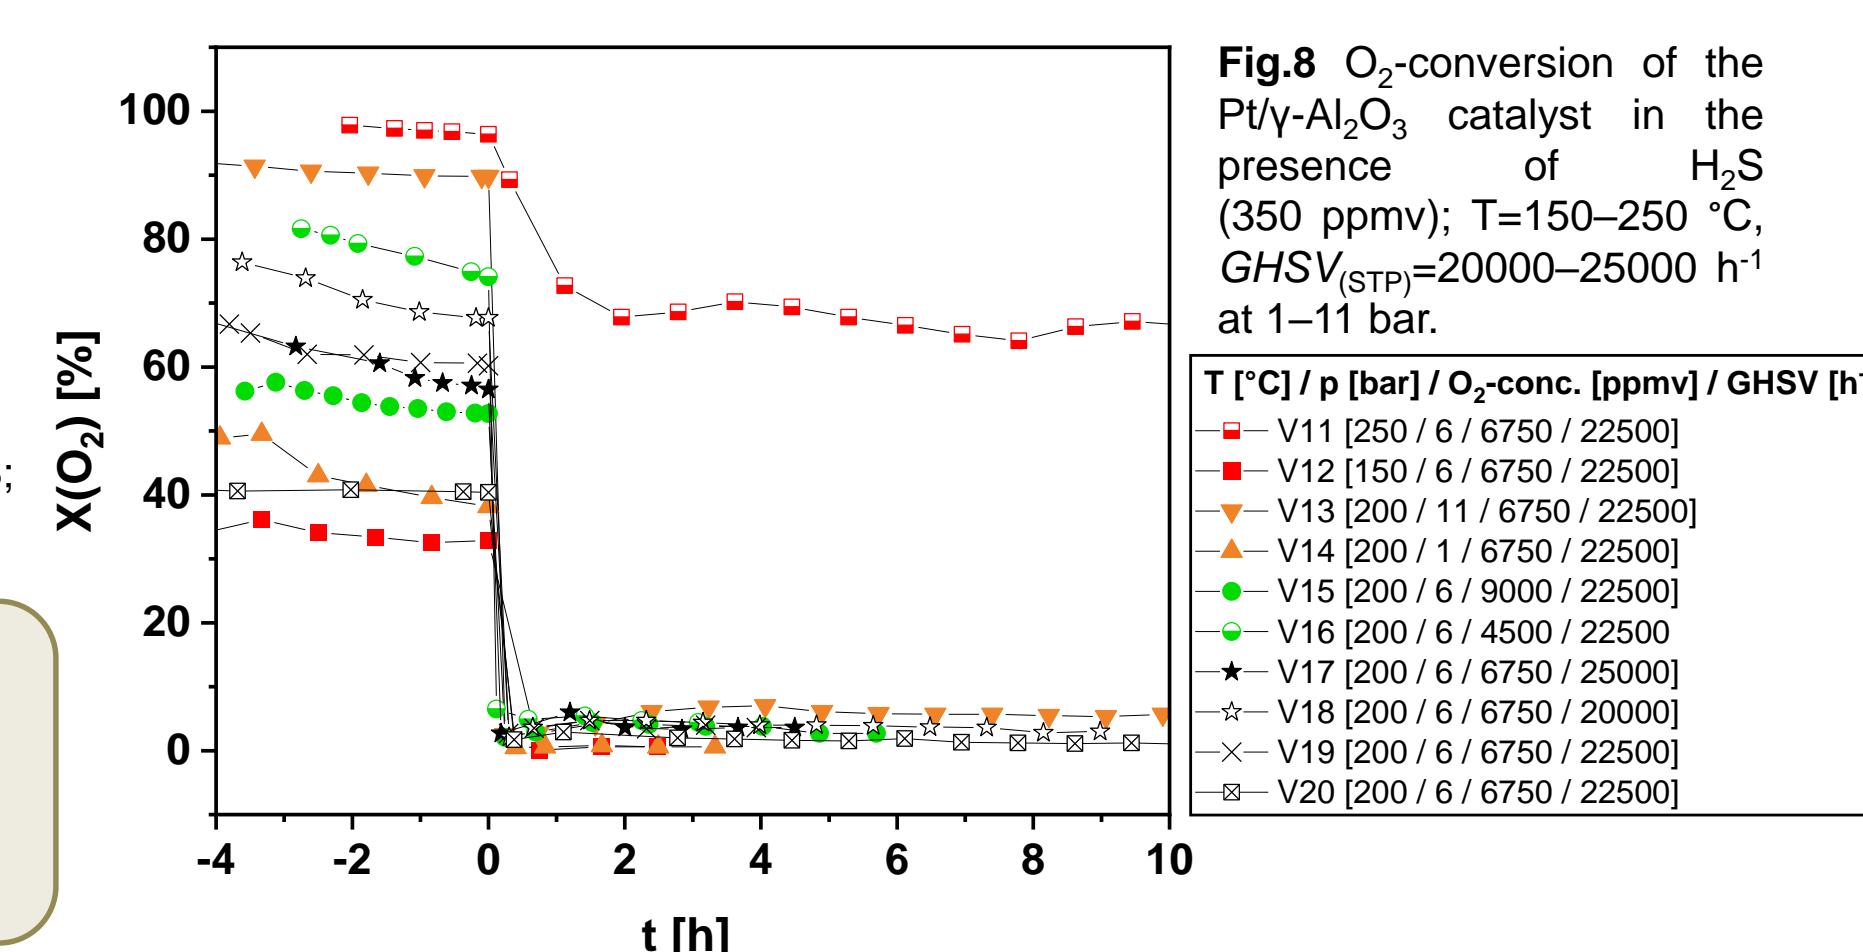

Fig.8 O₂-conversion of the Pt/γ-Al₂O₃ catalyst in the presence of H₂S (350 ppmv); T=150–250 °C, GHSV_(STP)=20000–25000 h⁻¹ at 1–11 bar.
